

The Semi-Humanoid Robot Market 2026

Global competitive landscape: wheeled, tracked and pedestal dual-arm humanoid robots

193 robots · ~120 companies · China · USA/Canada · Europe · Japan · Korea · Rest of world

Market study compiled 2 August 2026

1 Executive summary

The semi-humanoid — a human-like dual-arm upper body on a wheeled, tracked or pedestal base — is where humanoid robotics is actually being deployed in 2026. While bipedal humanoids dominate headlines and venture valuations, wheeled dual-arm robots dominate paying work: of the 193 systems documented in this study, 76 are shipping products and a further 23 are formally announced. China's "2026 Wheeled Humanoid Robot Industry Development Blue Book" counts >5,000 wheeled-humanoid units shipped in China in 2025 (~25–28% of Chinese humanoid volume), and Interact Analysis states plainly that wheeled platforms are "the preferred near-term form factor for real-world industrial deployment." Morgan Stanley's influential humanoid forecasts *exclude* wheeled-base torsos entirely — meaning the segment this study covers is systematically under-represented in headline market numbers, and correspondingly under-analyzed by competitors.

Seven findings that shape the opportunity:

- **China leads on volume and velocity.** 50 of 192 documented robots are Chinese; AgiBot alone shipped 5,100+ units in 2025 and passed 15,000 cumulative robots by June 2026. Real factory orders exist (Fulin Precision ~100× A2-W; Longcheer's hundreds-of-millions-RMB G2 order), and the supplier layer (chassis, actuators, hands) is commoditizing fast — entry prices now reach ¥26,900 (Unitree R1-D) and ~\$1,000–1,500 (SwitchBot Onero H1 target).
- **The US pivoted from bipeds to economics.** The 2025–26 US wave (Sunday Memo, Weave Isaac at \$7,999, Dexterity Mech, Dyna, Walden Robotics at a \$1.1B valuation out of stealth with Toyota as investor-customer) sells labor economics — RaaS by the hour, home robots by subscription — not anthropomorphism.
- **Regulation just redrew the map.** FCC Public Notice DA 26-786 (28 July 2026) added foreign-produced "advanced robotic devices" to the US Covered List: new foreign-made mobile, networked, AI-enabled robots — wheeled semi-humanoids squarely included — lose US equipment authorization unless granted a conditional approval. This fences the largest single market against Chinese, Korean, Japanese *and* European vendors alike, and materially raises the value of domestic/allied manufacturing footprints.
- **Europe is strong in research, fragmented in product.** PAL Robotics, Pollen/ Hugging Face, Neura's MiPA (€9,999 announced, deliveries slipping), igus's €47,999 Iggy Rob, Humanoid UK's \$1.35B valuation and Duatic's ETH-bred Alpha coexist with the cautionary tales of Aldebaran/Pepper (liquidated 2025) and Cybedroid. German research depth (DLR, KIT, TUM, FZI, Fraunhofer lineage) is world-class and under-commercialized — a talent and IP pool a German entrant can draw on.
- **Incumbents are converging on exactly this form factor.** Toyota's ELEY (QDD joints, scapular axis, wheeled base), Yaskawa's MOTOMAN NEXT + its quiet ownership of Tokyo Robotics, Midea's six-armed MIRO U, Kawasaki/Foxconn's Nurabot, Hexagon's AEON, plus component giants (Schaeffler backing Humanoid UK, Hexagon and reportedly Neura; LG investing in AgiBot and Dexmate while building its own CLOiD).
- **Data is the second product.** Nearly every serious player monetizes demonstration data: AgiBot World's million-trajectory dataset, Sunday's 2,000 paid glove-wearing "memory developers", 1X's security fleet feeding NEO, China's 40+ state-funded training centers. A hardware entrant without a data flywheel strategy competes on margins; with one, on compounding capability.
- **Certification favors wheels — for now.** Statically stable platforms certify under existing frameworks (ISO 13482, ISO 10218:2025, ANSI R15.08, UL 3300) while dynamically balancing robots await ISO 25785-1 (2026–27). The EU Machinery Regulation 2023/1230 (applies 20 Jan 2027, with AI-behaviour and cybersecurity requirements) is an opportunity for an EU vendor to lead on compliance-by-design.

Bottom line for a German entrant: the semi-humanoid category is real, growing, and — outside China — not yet locked up. The winning wedge combines (1) an industrial or care use case with demonstrable ROI, (2) compliance-by-design for the 2027 EU regime, (3) a data-collection strategy from day one, and (4) supply-chain positioning that exploits the new US restrictions on Chinese hardware rather than suffering them. Section 16 details the white spaces.

2 Scope, definition & methodology

Definition

A **semi-humanoid robot** has a human-like upper body — head and/or torso with **two arms** — whose legs are replaced by another locomotion or mounting concept: a wheeled base (differential, omnidirectional/mecanum, swerve, two-wheel balancing or ball-balancing), a tracked base, a lift column, or a fixed pedestal. SoftBank's Pepper is the textbook example; AgiBot's A2-W, Galbot's G1, Rainbow's RB-Y1 and Sunday's Memo are the 2024–26 generation. Included statuses: shipping, announced, prototype, research and notable discontinued systems. Excluded: bipedal humanoids, single-arm mobile manipulators (documented in Annex A where influential — Toyota HSR, Hello Robot Stretch), arm-only cobots, armless telepresence robots, and dual-arm machines without an anthropomorphic upper body. Wheel-leg hybrids (Tencent The Five, GAC GoMate, Hexagon AEON, Moon Dynamics L1) sit in the annex as borderline.

Method & data quality

Research was conducted in August 2026 through multi-lingual web research (English, Chinese, Japanese, Korean, German, French, Spanish, Russian): official vendor documentation and datasheets, trade press, financial media and filings, academic papers, community databases, teardown/forum material, and curated robot-description repositories. Every robot has a dossier (company profile, technical dossier, machine-readable spec sheet, source-attributed imagery — all images individually visually verified). **Every spec field carries a per-field source URL and one of three confidence ratings:** *vendor-claimed* (manufacturer statement), *third-party* (independently reported/verified), *estimated* (inferred). The companion xlsx preserves this per-field register (~3,400 source rows); the color coding in its matrix mirrors these ratings. Conflicting figures are retained with both values flagged rather than silently resolved. Where a vendor discloses nothing (a frequent Chinese and stealth-startup pattern), fields read "n/a (not disclosed)" — absence of a number is itself signal.

Caveats. This market moves at weeks-scale: 2026 alone brought the FCC action, Mobileye's \$900M Mentee acquisition, Walden's \$1.1B debut and several WAIC launches. Chinese shipment claims are frequently sell-in, not deployment (Interact Analysis: only ~10% of 2025 humanoid production reached real applications). Analyst forecasts diverge by >25× for 2035; we present ranges, not point estimates.

Corpus at a glance

Region	China	USA	Europe	Japan	Other	Korea	Canada
Robots	47	37	33	30	19	13	2

Status	shipping	discontinued	prototype	announced	research
Robots	74	38	26	25	18

Main-matrix corpus: 181 robots (plus 12 borderline/excluded in Annex A). "Other" combines Israel, India, Russia, Turkey, the Middle East, SE Asia and global/open-source projects. Canada is broken out in the xlsx but merged into the USA & Canada chapter here.

3 What the world calls this category

No single global term has settled; procurement, patent and market searches must cover all of the following. Chinese usage is the most developed — and China's Mobile Robot (AGV/AMR) Industry Alliance published a dedicated wheeled-humanoid Blue Book in May 2026 precisely because "the industry lacks unified standards and consensus."

Language	Term	Literal meaning	Prevalence / notes
Chinese	轮式人形机器人	wheeled humanoid robot	Dominant. Used by UBTech, CASBOT, Topstar, Robot Era; industry analyses claim wheeled models are >80% of deployed "humanoids"
	半人形机器人	semi-humanoid robot	Popularized by Pudu's D7 marketing; common in media
	轮式双臂机器人	wheeled dual-arm robot	Engineering/industrial framing (Fourier GRW, Rokae Helios)
	轮臂式机器人	wheel-arm robot	Emerging (Quectel, Zerith, KNEWBOTS)
	复合机器人	composite robot	Legacy term for arm-on-AMR; adjacent category
	超人形机器人	super-humanoid	New coinage for multi-arm forms (Midea MIRO U six-arm, iSageBot four-arm)
Japanese	セミヒューマノイド	semi-humanoid	Growing standard in 2025–26 trade press (AGIRobots, Pudu coverage); replacing older 上体型
	車輪型ヒューマノイド	wheel-type humanoid	Standard trade-press term, esp. for Chinese imports
	双腕ロボット	dual-arm robot	Dominant industrial term (Yaskawa SDA, Kawasaki); mobility-agnostic
	人型重機 / アバターロボット	humanoid heavy machinery / avatar robot	Niche coinages: Jinki Ittai's railway robot; teleop category (ugo, Ory's 分身ロボット "alter-ego robot")
Korean	이동형 양팔로봇	mobile dual-arm robot	Rainbow Robotics' official RB-Y1 category
	휠 휴머노이드 / 세미 휴머노이드	wheel humanoid / semi-humanoid	Trade press; Seoul Economic Daily's March 2026 "wheeled semi-humanoids gain traction" wave coverage
German	semi-humanoider Roboter / humanoider Roboter auf Rädern	—	Media descriptions; also "mobiler Manipulator", "Pflege-/Assistenzroboter" (application terms), "kognitiver Roboter" (Neura/Oversonic marketing)
	Roboter-Avatar	robot avatar	Telepresence subsegment (Devanthro Robody)
French	robot semi-humanoïde / humanoïde à roues	—	Also "robot majordome" (butler), "robot d'accueil" (reception)
Spanish	robot semihumanoide / humanoide con ruedas	—	Also "manipulador móvil"
English	wheeled humanoid / semi-humanoid / dual-arm mobile manipulator	—	All three common; analysts add "mobile manipulation platform"; Morgan Stanley excludes wheeled torsos from "humanoid" entirely

4 Market size & forecasts

The headline numbers — and why they mislead

Humanoid-robot forecasts span an extraordinary range: for 2035 alone, published market sizes run from ~\$9B (Precedence) through Goldman Sachs' \$38B TAM to ~\$250B (Future Market Insights) — a >25× spread driven by definitions, and long-horizon calls reach \$5T by 2050 (Morgan Stanley) and \$7T (Citi). Two structural facts matter more than any point estimate:

- **Semi-humanoids are under-counted.** Morgan Stanley's definition explicitly excludes "a humanoid torso mounted to a wheeled AMR and other bases that remain stable when powered down." The deployable end of the market is thus largely invisible in the most-quoted numbers — upside for anyone who counts properly.
- **Specialists are far more conservative than banks.** Interact Analysis (May 2026): >700k humanoid units/yr and ~\$15B revenue by 2035, commercial-viability inflection ~2032; 2025 production >20,000 units (10× 2024) but only ~10% deployed in real applications; China took >90% of production. Bank of America: 18k units 2025E → 1M/yr by 2030; BOM ~\$35k end-2025 falling to \$13–17k by 2030–35.

What is actually known about the wheeled segment

- **China Blue Book (AGV/AMR Industry Alliance, May 2026):** China wheeled-humanoid shipments >5,000 units in 2025, market value >RMB 1.8B (~\$250M) — the only hard unit datapoint for the segment; implies wheeled ≈25–28% of Chinese humanoid volume [third-party; derivation estimated].
- **2025 humanoid actuals (all form factors):** Omdia counts 13,318 global shipments with Chinese vendors in the top six (AgiBot 5,100+, Unitree ~4,200–5,500, UBTech ~1,000); Xinhua/CSJ report ~18,000 China-only (+650% YoY). Counting rules differ; both are directionally consistent: China ≈90% of world volume.
- **2026 outlook:** GGII forecasts 62,500 China humanoid shipments; Morgan Stanley doubled its 2026 China forecast to 50,000 units in June 2026; TrendForce sees >700% YoY global growth. Chinese executives talk "100–200k level". Manufacturing deployments are described by China Securities Journal as "essentially all wheeled + dual-arm configurations, because ROI is decisive."
- **Commercial-report shares conflict irreconcilably** (wheeled = 40.6% GMI vs 85.3% Roots vs ~37% FMI) — use unit-level evidence, not percentage claims.

Capital formation

Humanoid startups raised **\$6.1B across 139 deals in 2025** (PitchBook, +300% YoY) and **\$8.6B in the first seven months of 2026** — 1.8× all of 2025. China alone: ~RMB 39.8B across 325 deals in 2025 (+326%), and ≥RMB 100B invested in 2026 YTD — more than the previous five years combined — atop a ~RMB 1T (~\$138B) 20-year state fund and >RMB 70B of municipal funds. Semi-humanoid-relevant rounds include Galbot (~\$1.15B lifetime, \$3B valuation, backers from CATL to China's IC "Big Fund"), AgiBot (Tencent, BYD, LG; backdoor-listed via Shangwei), AI² Robotics (~\$735M at ~\$2.8–3B, July 2026), Atribot (unicorn, June 2026), Sunday (\$1.15B), Walden (\$300M seed at \$1.1B), Humanoid UK (\$1.35B), Dyna (~\$600M), Neura (Series C up to \$1.4B, Amazon/Nvidia participation, confirmed June 2026), and Mobileye's \$900M acquisition of Mentee. Government pull is Chinese policy: MIIT's 2023 guideline targets world-leading humanoid strength by 2027, with a reported 100,000-robot deployment goal.

5 Why wheels: the form-factor debate

The engineering case for replacing legs is quantitative, and vendors increasingly make it openly:

- **Cost.** Galbot founder Wang He: a wheeled chassis is ~10× cheaper than legs and more stable; bipedal locomotion "unnecessary... would increase costs." Wheeled entry prices (\$4,290 Unitree R1-D; \$7,999 Weave Isaac; ~\$14k Astribot T1) sit an order of magnitude below bipedal industrial pilots.
- **Energy.** Legged electric locomotion suffers Joule-heating losses at low speed/high torque. Typical bipeds run 2–4 h (Optimus V2 ~2.3 kWh ≈2 h; Unitree H1 864 Wh <4 h static); wheeled semi-humanoids run 5–16 h and increasingly hot-swap (AgiBot A2-W: 2 kWh, 5 h, swappable; Galbot G1: 8 h; Dexmate Vega: 10–30 h claimed).
- **Safety physics & certification.** Rodney Brooks: falling legs carry high kinetic energy — his prediction is that "humanoid robots will get wheels for feet." A statically stable base stops rather than falls on power loss, and certifies under existing standards today (see §14). Korea's March-2026 wave (T-Robotics: the wheeled hybrid is our "final form... will never build legs") and the UK's Humanoid ("wheels first") made this an explicit strategy, not a compromise.
- **Engineering focus.** Budget not spent on balance goes into arms, hands and autonomy — the parts that earn revenue (1X's EVE-before-NEO data strategy; Dexterity's 60 kg-lift Mech).

The counter-case remains real: stairs, curbs and cable-strewn floors; legs as a positioning system (Agility); the "little teapot" instability of a static base reaching far under load (Melonee Wise); and household TAM arguments that pushed 1X from wheeled EVE to legged NEO. The pragmatic industry answer is increasingly modular lower bodies (Appttronik Apollo wheeled/legged variants; AgiBot X2-N leg-wheel switching) and wheel-leg hybrids (Hexagon AEON, GAC GoMate) — hedges that concede the near-term economy of wheels.

6 Regional landscape — China

50 documented robots — the deepest, fastest, cheapest market. Three strata: (1) **scale leaders** — AgiBot (5,100+ units 2025, 15,000 cumulative by June 2026, Fulin and Longcheer factory orders, backdoor-listed), Galbot (\$3B valuation; licensed robot pharmacies, ~170 unmanned kiosks, factory pilots at Mercedes-Benz China/CATL/ Zeekr), UBTech (Cruzr S2, exported to Japan via GA Robotics), Pudu and Keenon riding 100k/80k-unit service-robot install bases; (2) **technology specialists** — Atribot (10 m/s end-effector speed, \$14k T1), PaXini (~2,000 tactile sensors), Spirit AI (full force control), DexForce (Sim2Real), Robot Era (Haier's "HIVA" is its rebadged Q5); (3) **incumbent entrants** — Midea (six-armed MIRO U in its own washing-machine plant; owns KUKA), JAKA/Rokae/Elite/Topstar/Siasun from the cobot/industrial world, Fourier from rehab, plus ecosystem oddities from four-armed iSageBot to ByteDance's research ByteMini. A dedicated supplier layer (SEER's C1-D humanoid chassis, Realman's joint modules with claimed 50,000 h MTBF, Inspire hands) is commoditizing construction; data-collection platforms (ARX, AgileX, Galaxea, HEXFELLOW) arm the world's embodied-AI labs. Weaknesses: near-zero published safety certifications, sell-in vs deployment gaps, financial distress cases (CloudMinds), and now the US FCC wall.

Robot / Company	Status	Base	kg/arm	Price	Deployment evidence
AlphaBot 2 爱宝 (Aibao) AI² Robotics	shipping	wheeled mobile base with retractable waist-leg torso	10	n/a	Geely Jingneng Microelectronics semiconductor fab (03/2025-); Bloomage Biotech cleanrooms; automotive plants;
LIFT2 (ARX-LIFT2) ARX-LIFT2 ARX Robotics	shipping	omnidirectional wheeled base with motorized lift column	5	from CNY 249,800	wide adoption in Chinese research labs as ALOHA-style platform; no unit counts disclosed
A2-W 远征A2-W AgiBot (Zhiyuan Robotics)	shipping	wheeled (4WD omni, zero turning radius, crab-walk)	5	RMB 400k-800k (~USD 56k-112k) insider range, not officially published	Fulin Precision ~100-unit order 08/2025 (tens of millions RMB); 4-robot demo 800+ totes/3h zero failures; batt
Genie G2 精灵G2 AgiBot (Zhiyuan Robotics)	shipping	wheeled (4-DoF omnidirectional chassis: omni, crab-walk, in-	5	not disclosed; predecessor Genie G1 at RMB 450k (~USD 62k)	Longcheer ~1,000-unit framework order (hundreds of millions RMB) for tablet lines; Junpu Intelligent automotiv
Cobot Magic Cobot Magic (Mobile ALOH AgileX Robotics	shipping	Tracer two-wheel differential AGV base, 685x570x155mm, 100kg	1.5	~USD 48k class via distributors (India listing ₹3,999,999); config-dep	global research-lab adoption; AgileX Tracer base underpinned Stanford Mobile ALOHA
S1 Atribot S1 Atribot (Stardust Intelligence)	shipping	wheeled (3-DoF omnidirectional base) + flexing torso column;	10	research edition ~RMB 500k (~USD 69k); B2B quote; T1 sibling from RMB	JD.com, CCTV, elder-care institutions, retail in six cities; reported thousand-unit Thundersoft order (unverif

Robot / Company	Status	Base	kg/arm	Price	Deployment evidence
T1 Astribot T1 Astribot / Stardust Intelligence	shipping	wheeled (compact base)	5	from RMB 89,900 (~USD 13k); higher-spec variant ~RMB 99,000 reported	first unit shipped 2026-06-01; mass production reported from 2026-07-09 (Wuxi); no named T1 customers publicly
CASBOT W1 / W2 灵貳 CASBOT (Beijing Zhongke Huiling Robot Technology)	shipping	bipedal legs (NOTE: discovery misclassified 02 as wheeled; t	n/a	from RMB 328,800 on JD.com (02); 02 Lite dev platform RMB 99,000 promo	first JD orders within 48h of June 2025 listing; family robots working on Lenovo notebook assembly line; CASBO
U05 (UU U05) 优友 U05 Canbot	shipping	three-wheel wheeled base, auto-docking charging	n/a	HKD 320,000 (HK reseller, historical/out-of-stock)	hundreds of commercial deployments 2016-19 (banks, hospitals, airports, malls); National Day 70th anniversary,
W1 Pro 跨维W1 Pro DexForce	shipping	wheeled; omnidirectional (40 DoF config) or differential (34	10	n/a	vendor-listed partners: Huawei, BYD, Foxconn, Panasonic, Toyota, SOEs (aerospace/chemical/shipbuilding); coffe
Mercury X1 Mercury X1 水星X1 Elephant Robotics	shipping	wheeled AGV base (torso = Mercury B1)	1	USD 15,999 (X1); Mercury B1 torso ~EUR 17,599 at EU reseller	commercially listed at multiple international resellers since 2024; education/research users; volumes not disc
R1 Pro 星海图 R1 Pro Galaxea AI	shipping	wheeled omnidirectional; 3 self-developed steering-wheel mod	3.5	USD 69,999 (US reseller Robotopian)	research labs in CN + international; reference platform for Galaxea G0 VLA work; no industrial production depl
G1 Galbot G1 Galbot (Galaxy General)	shipping	wheeled omnidirectional base + single telescoping/folding le	5	JD.com RMB 690-700k (~USD 97k); flash sale RMB 630k 02/2026; US resell	~170 unmanned kiosk stores/pharmacies in 40+ cities; Haidian pharmacy license 2026-03-12; CATL/Mercedes-Benz C
Juliet 朱丽叶 Haohai Xingkong (HHS Robotics)	shipping	wheeled composite humanoid (concealed wheeled base)	10	n/a	Nanjing Road cabin (2 units, from 2026-02-13): 61,198 visitors, 2,368 orders, 3,082 items sold during Spring F
e3 (e³-Mobile / e³-Desktop / e³-Mobile-π) e³ HexFellow Robotics	shipping	modular: TRIGGER-A3 3-omni-wheel holonomic (π variant) / MAV	2	not disclosed (quote-based storefront)	no named customers/unit counts; active GitHub (75 repos) and community
K1W 节卡 K1W JAKA Robotics	shipping	wheeled omnidirectional base + lifting/pitching waist	n/a	n/a	working in a Fortune-500 enterprise factory (sorting/handling/tending/inspection); 300+ embodied-family units
XMAN-R1 XMAN-R1 (擎朗具身服务机器人) Keenon Robotics	shipping	wheeled (2-DoF chassis, two wheel modules under kneeling-leg	3	~USD 100,000	Shangri-La Traders Hotel Shanghai Hongqiao commercial deployment (announced 2025-10-31) in multi-robot model w

7 Regional landscape — USA & Canada

39 documented robots (incl. Canada) — the economics wave. The 2025–26 US generation sells labor, not robots: Sunday's Memo (Coatue-backed, \$1.15B, glove-collected ~10M episodes, <\$10k target, beta by Thanksgiving 2026), Weave's \$7,999/\$449-mo Isaac, Robot.com's R-Noid and Eden's \$10/hour RaaS, Dyna's laundry robots at 99%+ 24-h success, Reflex's teleop-to-autonomy warehouse play (GXO; sub-\$50k target; Mexico factory), and Dexterity's 60 kg "superhumanoid" Mech (Kawasaki-built arms, Sanmina manufacturing). Walden Robotics crystallizes the moment: Russ Tedrake's TRI spin-out emerged July 2026 at a \$1.1B valuation with robots already in production shifts at a Toyota plant. Public-market reality check: Richtech (NASDAQ: RR) pairs a \$180k ADAM install base with \$5M revenue and governance flags. Canada contributes Sanctuary's hydraulic-hand Phoenix (now software-pivoted) and Kinova's discontinued MOVO. The deep research heritage — PR2, Baxter, Mobile ALOHA (\$32k BOM that spawned Sunday and the ALOHA-clone industry), Robonaut 2, TRI Punyo — remains the field's intellectual substrate. The FCC Covered-List action (§14) now shelters this market from foreign hardware — and pressures everyone else's US strategy.

8 Regional landscape — Europe

34 documented robots — research superpower, fragmented commercially. Active products span PAL Robotics' TIAGo Pro/++/ARI (the EU research standard), Pollen/Hugging Face's open-source Reachy 2 (~\$70k), igus's €47,999 plastics-based Iggy Rob, Oversonic's RoBee (STMicroelectronics deal, US launch — but certifications are CE-machinery grade, not robot-safety), Enchanted Tools' ball-balancing Mirokai in French hospitals, and Duatic's ETH-lineage Alpha (12 kg continuous dual-arm payload, IP66). Humanoid (UK) became Europe's newest unicorn (\$1.35B; Bosch and Schaeffler backing; wheeled Beta units Q4 2026); Franka's Mobile FR3 Duo gives European labs a domestic reference platform; Wandercraft's Calvin (bipedal, hence annexed) took Renault's money into real plants; and Munich's RobCo — fresh off a \$100M Series C — announced its bimanual, humanoid-form "Alfie" in April 2026 (officially shown only from the waist up — though its promo video briefly reveals a mobile base in simulation), moving Germany's best-funded modular-robot startup into the category via RaaS. Germany specifically: Neura's MiPA is the declared household/care entrant (€9,999, deliveries slipping; Series C up to \$1.4B confirmed June 2026), Devanthro sells care-avatar telepresence, and the research bench — DLR's Justin, KIT's ARMAR-III, TUM's GARMI (no spin-off exists — available IP/talent), FZI's HoLLiE — is unmatched but under-commercialized. Cautionary tales are equally instructive: Aldebaran (Pepper) liquidated in 2025 with its assets sold to a Chinese buyer; Care-O-bot's maker became an AMR vendor; Cybedroid sold 6 units and died. A telling blank on the origin map: the Nordics. Norway created the archetypal wheeled humanoid (Halodi/1X's EVE) but the company relocated to Palo Alto and pivoted to legs; Sweden's entry (Hexagon's AEON, Schaeffler-backed) is a wheel-leg hybrid sitting in this study's borderline annex; and Denmark's Odense cluster — Universal Robots' arms, MiR's bases — supplies the category's components without ever assembling a semi-humanoid of its own. Europe's gap is not capability but industrialization — precisely the entry a well-capitalized German robotics company can make ahead of the 2027 Machinery Regulation.

9 Regional landscape — Japan

31 documented robots — the longest institutional memory, now re-mobilizing. Japan invented the category's ancestors (wakamaru 2005, enon, SmartPal, Twendy-One, ROBEAR) and its icon: Pepper (~27,000 produced — still the largest semi-humanoid fleet ever; B2B support continues in Japan, with a "Pepper+" rental relaunch in 2026 even as Aldebaran died in Europe). Today's activity clusters in: **teleoperation-first services** (ugo Pro in building security; Ory's OriHime-D café employing 70+ disabled pilots — a social-innovation model unique to Japan; Jinki Ittai's "humanoid heavy machinery" in revenue service on JR West railways); **industrial dual-arm incumbents** (Kawada NEXTAGE since 2009; Yaskawa's MOTOMAN NEXT AI line — and note Yaskawa wholly owns Tokyo Robotics, whose Torobo2 builds Waseda's AIREC care robot: one keiretsu quietly spans Japan's flagship care program and its industrial dual-arm line); **hospital/care pilots** (Kawasaki Nyokkey at Fujita Health University; Foxconn/Kawasaki Nurabot launching FY2026); and **Toyota's ELEY** — QDD actuators in every joint, a scapular axis, and a production-site learning agenda: the highest-credibility incumbent program worldwide (§12). Tracked outlier: Mitsubishi Electric's Diaroid. Japanese firms also increasingly distribute Chinese wheeled humanoids (Cruzr S2 via GA Robotics), importing the competition.

10 Regional landscape — South Korea

13 documented robots — chaebol-scale bets plus an explicit 2026 wheeled wave. Rainbow Robotics' RB-Y1 (\$80k research/\$120k commercial) is the flagship: Samsung took 35% control for \$181.6M, consolidated it, and stood up a Future Robotics Office; Coupang logistics pilots are confirmed. ROBOTIS ships the fully open-source AI Worker (swerve drive, imitation-learning workflow); XYZ's DEUX (\$29,900 fixed / \$39,900 mobile, 3-finger hands + Glove X data pipeline) targets retail restocking; LG's CLOiD (CES 2026, "Zero Labor Home", pilot production July 2026) attacks the home — while LG hedges via investments in AgiBot and Dexmate. The March-2026 "wheeled semi-humanoid wave" (Seoul Economic Daily) added listed incumbents T-Robotics ("will never build legs") and I.L's ILBOT (mass production since Feb 2026), plus Neubility's announced Billy and Neuromeka's cart-based EIR. Hyundai's DAL-e and legacy research (KIST, KAIST M-Hubo, NAVER AMBIDEX) round out a market whose defining feature is vertical integration into memory-chip-grade manufacturing supply chains.

11 Regional landscape — Rest of world

17 documented robots. Israel: Unlimited Robotics' Gary (~10 units in a Philadelphia hospital plus Israeli MoH deployments) — and Mobileye's \$900M acquisition of Mentee (bipedal line; the rumored wheeled variant does not exist) shows the exit ceiling. India: from Invento's wound-down Mitra to Genrobotics' 200-kg-payload tracked GenBot, Perceptyne's assembly torsos and ISRO's space-bound Vyommitra (Gaganyaan G-1, now Q3 2027). Russia: Promobot's V.4 service fleet (800+ units claimed) persists, but its Robo-C android line is discontinued and the FCC action closes the US. Turkey's AKINROBOTICS, Saudi Arabia's QSS, Nepal's Paaila and Vietnam's defunct TOPIO show the long tail. The open-source movement matters strategically: XLeRobot (~\$660, 5.4k GitHub stars), BamBot (~\$300), InMoov and hobbyist builds like Nyro (differential-gear joints, QDD motors) are training a generation on semi-humanoid architecture — tomorrow's engineers and tomorrow's expectations.

Robot / Company	Status	Base	kg/arm	Price	Deployment evidence

TOPIO Dio TOSY Robotics JSC	discontinued	wheeled (3-wheel omnidirectional platform)	n/a	n/a	trade-show demos only (AUTOMATICA 2010); no customers documented

12 Technology trends

Foundation models made the category investable

Vision-language-action (VLA) models are the demand engine: Physical Intelligence's $\pi 0/\pi 0.5$ run long-horizon household tasks on *wheeled* mobile manipulators (\$5.6B valuation, ~\$1B raise in talks); NVIDIA's GR00T, Google's Gemini Robotics 2 (whole-body control, adapts to new hardware with <200 examples), AgiBot's GO-2, Galbot's GraspVLA (billion-frame synthetic pretraining) and Figure's Helix define the stack. Consequence: hardware is increasingly judged as a **data-collection and policy-execution vehicle**. AgiBot World's million-trajectory dataset was collected on wheeled G2s; Sunday's 2,000 paid "memory developers" wear gloves whose geometry its robot hand mirrors; China operates 40+ state-funded training centers; 1X's EVE security fleet trained NEO. Teleoperation is not a stopgap but a revenue-generating data business (Reflex, ugo, Beomni) — Interact Analysis expects deployments to remain "predominantly semi-autonomous" near-term.

Hardware convergence

The 2026 median semi-humanoid: two 7-DoF arms; 20–40 total DoF; 3–5 kg per-arm payload (10–20 kg for logistics classes; outliers: Dexterity 60 kg, Duatic 30 kg peak, Realman 5 kg official); 1.3–1.75 m height, often with a lift column or folding torso (floor-to-2 m+ work envelopes: Galbot 2.4 m, AI² 0–2.4 m, Dexmate 0.66–2.2 m); omnidirectional wheels at ~1.5–2 m/s; 5–8+ h runtime with hot-swap batteries; 3D lidar + multi-RGB-D + wrist F/T sensing; NVIDIA Jetson Orin (now Thor: Richtech Dex, Dexmate) as de-facto compute; ROS 2 plus a proprietary autonomy/VLA layer. Actuation splits between QDD/backdrivable philosophies (Toyota ELEY, Duatic DynaArm, Spirit AI full force control) and harmonic/planetary precision claims (± 0.03 –0.1 mm: JAKA, Elite, iSageBot).

Hands and end-effectors

Parallel grippers still dominate deployments; dexterous hands are differentiating fast: Chinese five-finger hands now start under \$1,400 (Inspire ubiquitous; the market grew ~150% YoY into a "mass-production race"), Western options run to Shadow's ~\$300k; in-house designs (Pudu DH11, XYZ's 7-DoF 3-finger + Glove X, Sanctuary's hydraulic 21-DoF, PaXini's ITPU tactile arrays) anchor product identity. Tool-changers and media at flange remain rare disclosures — an open differentiation axis for industrial-grade entrants. Notably, several "humanoid" vendors ship off-the-shelf EEs (1X EVE used a Robotiq 3-finger; OpenDroids integrates RealMan hands).

13 Pricing & business models

Band	Examples (2026 street/list prices)	Model
<\$5k	Unitree R1-D ¥26,900 (~\$4.3k); open kits (XLeRobot \$579–660, BamBot ~\$300)	Entry/education; ecosystem seeding
\$5–30k	Weave Isaac \$7,999 or \$449/mo; Almond Axol from \$7,999; Atribot T1 ~\$14k China / \$40,950 via Western resellers; Elephant Mercury X1 \$15,999; SwitchBot Onero H1 target ~\$1–1.5k (pre-production); WorkFar tiers \$10–60k; XYZ DEUX \$29.9–39.9k; Techman ~\$25k est.	Home subscriptions; research/edu; prosumer
\$30–100k	Deft Simba \$34,900; igus Iggy Rob €47,999; AgiBot A2 Lite \$44.6k; A2-W ¥400–800k insider; Atribot S1 ~\$69k; Reachy 2 ~\$70k; UMA Northstar ~\$70k; Noble \$75k; Rainbow RB-Y1 \$80k research; Dexmate Vega \$89,999; Genesis Eno ~\$90k; Galbot G1 ~\$91–97k; Keenon XMAN ~\$100k; PAL TIAGo Pro ~\$85–95k	Industrial/research purchase; the segment's center of gravity

Band	Examples (2026 street/list prices)	Model
>\$100k	Rainbow RB-Y1 commercial \$120k; Richtech ADAM \$180k; Ameca ~\$250k; CASBOT 02-class ¥328.8k; CloudMinds Ginger ¥698k; research heritage (PR2 \$400k)	Premium/entertainment/legacy
RaaS	ADAM \$3,500/robot/mo (25-unit 60-mo contract); AgiBot A2 ~\$20k+/mo; delivery-class \$300–800/mo; Eden \$10/hour; home \$449–499/mo (Weave, 1X NEO)	Labor-substitution pricing; dominant new-entrant model in the US

Note the China-vs-export gap: the same robot often costs 2–3× more through Western resellers (Atribot T1: ~\$14k domestic vs \$40,950 US reseller list) — tariffs, support and channel margins that an EU-based vendor does not pay locally. Pattern: Chinese street prices cluster at \$45–100k industrial (falling — some wheeled models below RMB 100k), Western/Korean at \$80–180k, and a new sub-\$15k consumer/edu front opened in 2025–26. Maintenance contracts (Deft: \$30k/yr on a \$40k robot) and software/support subscriptions (Galbot ~\$27k/robot/yr) shift lifetime value off the sticker price. History's warning: Pepper's ~\$9k consumer bundle lost money at ~27,000 units and the business died; unit economics, not unit counts, decide survival.

14 Safety, standards & regulation

- **ISO 13482** (personal care robots — mobile servant class fits semi-humanoids): 2014 edition current; revision (retitled toward "service robots", broadened to professional applications, FDIS stage mid-2025) expected imminently.
- **ISO 10218-1/-2:2025** published: industrial robot safety overhauled with functional safety, cybersecurity and collaborative requirements; TS 15066 folded in. **ANSI/RIA R15.08** covers industrial mobile robots with mounted manipulators; **UL 3300** (service robots in public spaces) joined OSHA's NRTL list Dec 2025.
- **The wheeled certification advantage:** statically stable platforms certify under all of the above *today*; dynamically balancing robots await **ISO 25785-1** (committee draft; expected 2026–27). IEEE's humanoid-standards pathway study (2025) puts ratified humanoid standards 18–36 months out.
- **EU:** Machinery Regulation 2023/1230 applies **20 January 2027** (no grace period): self-evolving-behaviour assessment, cybersecurity of safety functions, digital documentation — layered with the AI Act. Burden for laggards; moat for compliance-by-design vendors. TÜV-grade certification of a dual-arm mobile platform is an unclaimed European first.
- **USA — the 2026 discontinuity:** FCC Public Notice **DA 26-786** (28 July 2026) added "foreign-produced advanced robotic devices" to the Secure Networks Act Covered List: any mobile ground robot >4.4 lbs with environmental sensing, ≥200 kbps connectivity and AI autonomy loses FCC equipment authorization for new models unless granted a Department-of-War conditional approval. Fixed industrial robots are exempt; wheeled/tracked semi-humanoids are squarely in scope. Practical effects: Chinese vendors lose the US; Korean/Japanese/European vendors need approvals or US manufacturing ("domestic end product" per 48 CFR 25.101(a)); US integrators re-source components.
- **China:** MIIT stood up a humanoid/embodied-AI standardization committee (Nov 2025; Unitree and AgiBot founders as deputy chairs) and unveiled the first national humanoid standard system in March 2026; existing GB/T service-robot safety standards apply meanwhile. Shanghai issued the first humanoid governance guidelines (2024).

Observed reality: among 180 main-matrix robots, published robot-safety certifications are rare to absent — including for market leaders. Oversonic's "industrial + healthcare certified" claim resolves to CE-machinery + ISO 27001. A vendor that can put ISO 13482 / MR-2027-ready CE on a dual-arm mobile platform holds a genuinely scarce asset.

15 Deployment evidence: who is really working

Deployment class	Evidence (confidence)
Historic scale	Pepper: ~27,000 produced / ~17,000 sold, worldwide retail & reception (third-party) — still unmatched
Factory production shifts	AgiBot A2-W at Fulin Precision (~100-unit order; 4 robots moved 800+ boxes/3 h) and G2 at Longcheer (310 units/h tablet line) (third-party); Walden W0.5 in 8-h shifts at a Toyota plant since Feb 2026 (vendor/third-party); Midea MIRO U in its Wuxi plant (vendor); Zoomlion internal fleets (vendor)
Retail/pharmacy autonomy	Galbot: 10+ licensed Beijing robot pharmacies, ~170 kiosks in 40+ cities, 99.5% grasp claim over ~5,000 SKUs (vendor-claimed); Haohai "Juliet" pods on Nanjing Road (2,368 orders in first months, third-party)
Hospitality/F&B	Richtech ADAM: Walmart-hosted One Kitchen sites, Vegas café (16k+ drinks), arenas (vendor/third-party); Keenon XMAN-R1 at Shangri-La; Zerith H1 in 20+ hotels (third-party)
Healthcare/eldercare	Gary: ~10 units Philadelphia + Israeli MoH (third-party); Nyokkey at Fujita hospitals; Mirokai at AP-HP/Montpellier; Aeolus Ae0 in Japanese eldercare (operators are also investors)

Deployment class	Evidence (confidence)
Security/infrastructure	1X EVE via Everon/ADT: est. 150–250 US buildings (estimated); ugo Pro in Japanese buildings (third-party); Jinki Ittai on JR West railways — revenue service since July 2024 (third-party)
Logistics pilots	Reflex at GXO; Rainbow RB-Y1 at Coupang (confirmed); Dexterity Mech truck-loading pilots + Sanmina manufacturing (third-party)
Home (beta)	Weave Isaac deliveries from Sept 2026 (CA); Sunday Memo beta "by Thanksgiving 2026"; 1X NEO late 2026 — all pre-scale (vendor-claimed)

Contrast: flagship bipedal deployments remain single-to-low-double-digit robot counts (Figure/BMW: 2 robots; Agility/GXO: "small fleet"). The wheeled category's deployment lead is roughly two orders of magnitude.

16 Competitive assessment for a German entrant

Where the openings are

- **EU-certified industrial semi-humanoid.** No vendor holds robot-safety-grade certification for a dual-arm mobile platform under the incoming MR 2023/1230 regime. German TÜV culture + the domestic research bench (DLR torque control, KIT ARMAR manipulation, Franka-class compliant arms) make compliance-by-design the natural differentiator against spec-sheet-led Chinese imports.
- **Care & hospital logistics in Europe.** Demographics guarantee demand; the credible platforms are pilots (GARMI has no spin-off; HoLLiE stayed academic; MiPA is late; Mirokai is logistics-only). ISO 13482 + hospital-grade hygiene + Devanthro-style teleop fallback is an assemblable, defensible package.
- **US market via the FCC wall.** A German vendor with US final assembly ("domestic end product") can sell where Chinese rivals now cannot — the single largest regulatory gift to Western robot makers in years. Walden's \$1.1B day-one valuation prices exactly this scarcity.
- **Data flywheel as default architecture.** Ship every unit teleop-capable and log demonstrations under EU-grade data governance ("GDPR-clean embodied-AI data" is itself a product for European enterprise customers wary of Chinese and US clouds).
- **Component strategy.** Schaeffler (actuators; invested across Humanoid UK, Hexagon, reportedly Neura), igus (polymers), Franka/Agile (arms), SICK/IDS (sensing) form a domestic supply chain; the missing integrator role is the opportunity.

Threat tiers (analyst view)

Tier	Actors	Why
Severe	AgiBot, Galbot, UBTech; Keenon/Pudu channels; Unitree price disruption	Scale, capital, data, falling prices; EU entry inevitable (Rokae already exhibits in the West)
High	Toyota ELEY, Yaskawa(+Tokyo Robotics), Samsung/Rainbow, LG, Hexagon/Schaeffler, Walden	Incumbent capital + manufacturing + patient roadmaps
Medium	Humanoid UK, Neura, Sunday/Weave/Dexterity/Dyna, Richtech, Oversonic, Enchanted Tools	Funded and fast, but each thesis still unproven at scale
Watch	SwitchBot/consumer-price entrants; open-source kits; Genesis-class model labs; Vassar/Piggy/HABIT-type YC stealth	Price-floor and expectation-setting effects

Recommended posture

Enter as the certified European industrial/care semi-humanoid with a data flywheel. Concretely: (1) wheeled omnidirectional base + lift torso, dual 7-DoF compliant arms in the 5–10 kg/arm class, tool-changer + media at flange (an undisclosed axis across nearly all competitors); (2) MR-2027/ISO-13482 compliance engineered from day one and certified loudly; (3) launch vertical where ROI is provable within one budget cycle — intralogistics machine-tending or hospital logistics — with RaaS pricing against the \$3.5k/mo ADAM benchmark; (4) teleop + demonstration-data capture in every unit; (5) US strategy via local assembly partner from year one; (6) strategic component alliances (Schaeffler/Franka/igus) rather than full vertical integration. Speed matters: the Korean incumbent wave shows how fast listed industrials can pivot, and Chinese price curves compress the window in which "European + certified + trusted" commands a premium.

17 Annex A: Borderline & excluded systems

Documented for completeness; excluded from the main matrix. Full dossiers exist for each in the repository.

18 Annex B: Research repository guide

This study compresses a research repository delivered alongside it:

- **companies/<company>/company.md** — company profile: ownership, funding, strategy, sources.
- **companies/<company>/<robot>/robot.md** — full dossier: morphology, locomotion, manipulation, sensing, actuation, compute/software, safety, deployment evidence, analyst assessment, numbered sources.
- **.../specs.json** — machine-readable spec sheet; every field carries value + confidence (vendor-claimed / third-party / estimated) + source URL. These files generate the xlsx.

- **.../images/** — downloaded imagery, each visually verified; images.md maps every file to its source page, direct URL, caption and licence note.
- **semi_humanoid_market_2026.xlsx** — Overview, full 34-column spec matrix, per-region sheets, Borderline & excluded, ~3,400-row per-field source register, confidence colour legend.

Compiled 2 August 2026. Sources were accessed August 2026; the per-field register in the xlsx is authoritative for citations. Confidence discipline: vendor-claimed figures are marketing until deployed; third-party validation is noted wherever it exists; conflicts are preserved, not averaged.
